TEMPERATURE-pH METERS

The **HD2105.1** and **HD2105.2** are portable instruments with a large LCD display. They measure the pH and the redox potential (ORP) in mV. They measure the temperature using Pt100 or Pt1000 immersion, penetration or contact probes.
The electrode calibration can be carried out on one, two or three points and the calibration sequence can be chosen from a list of 13 buffers.
The temperature probes are equipped with an automatic recognition module and factory calibration data are stored inside.
The HD2105.2 is a **datalogger**. It stored up to 34,000 pH and temperature samples which can be transferred to a PC from the instrument connected via the multi-standard RS232C serial port and USB 2.0. The storing interval, printing, and baud rate can be configured using the menu.
The HD2105.1 and HD2105.2 models are fitted with an RS232C serial port and can transfer the acquired measurements in real time to a PC or to a portable printer.
The *Max, Min* and *Avg* function calculate the maximum, minimum or average values.
Other functions include: the relative measurement REL, the Auto-HOLD function, and the automatic turning off that can also be excluded.
The instruments have IP67 protection degree.

HD 9609

HD 9609
pH AND mV SIMULATOR

GENERAL CHARACTERISTICS

The simulator **HD 9609** is a portable instrument for checking and calibrating pH and mV measuring instruments. The characteristics of this instrument satisfy any checking and calibrating requirements for both portable and panel-mounted instruments; it may be used in laboratories, in industry or for checks in the field.
Despite its many functions, the instrument is simple to use: a large display, with dual indication, and a series of symbols allow it to be used even by unskilled personnel.

The HD9609 sends to output in channel A the simulation of signals of an electrode for measuring pH, ORP, ISFET, in the range:
- 0 to 14 pH, with resolution 0.10 pH;
- ±1999 mV, with resolution 1 mV.

The user may choose between two output impedance values:
- 100 KΩ, low impedance;
- 1 GΩ, high impedance.

The simulation of the electrode compensation temperature is manually programmed in the range from -20°C to +150°C, while the temperature is measured in degrees Celsius or Fahrenheit.
The pH simulation values may be manually set as desired, in steps of 0.1 or 1 pH.
The mV simulation values may be manually set as desired, in steps of 1 or 10 mV.
The HD9609 is fed with an ordinary 9Vdc alkaline battery.
The electronics are housed in a sturdy ABS case with ergonomic lines.
In designing and making the instrument, each detail has been assessed and selected in order to provide an instrument with high performance and excellent long-term measurement stability.

DO 9403T-R1
pH/mV TRANSMITTER

The **DO 9403T-R1** pH transmitter converts the output of a pH electrode, with temperature compensation, into a signal at 4÷20 mA. The pH or Redox electrode input circuit is galvanically insulated against the 4÷20 mA output signal.
An LCD indicator allows viewing of the process signal value and of the various parameters. The accurate design and choice of components make the instrument precise and reliable for a long working life.
The instrument works with a pH or Redox electrode and a temperature probe (Pt100 sensor, 100 Ω at 0°C).

Key functions

PRG Programming of the parameters is activated by pressing the PRG key. The Δ symbol lights up on the display and the message P1 appears, indicating that the parameter P1 is being programmed. When the PRG key is pressed continuously, the messages P2, P3, P4, P5, P6, P7, P8, P9, P10 and the corresponding parameters are displayed in sequence. After P10 the instrument returns to normal function.
After the parameter concerned gas been displayed, it is possible to view its value by pressing the OK key. To change the parameter use the ▲ and ▼ keys. Press the OK key again to confirm the value of the parameter.

pH TRANSMITTERS

DO 9785T/DO 9765T pH transmitters convert the output of a pH electrode, with temperature compensation, into a signal at 4÷20 mA. The pH electrode input circuit is galvanically insulated against the 4÷20 mA output signal.
An LCD indicator allows viewing of the process signal value and of the various parameters. The accurate design and choice of components make the instrument precise and reliable for a long working life.
The instrument works with a pH electrode or Redox and a temperature probe (Pt 100 sensor, 100 Ω at 0°C).

HD 2106.1, HD 2106.2
CONDUCTIVITY METERS - THERMOMETERS

The **HD2106.1** and **HD2106.2** are portable instruments with a large LCD display. They measure conductivity, liquid resistivity, total dissolved solids (TDS), and salinity using combined 4-ring and 2-ring conductivity/temperature probes. Temperature only is measured by Pt100 or Pt1000 immersion, penetration or contact probes.
The probe calibration can be performed automatically in one or more than one of the 147µS, 1413µS, 12880µS or 111800µS/cm conductivity calibration solutions.
The temperature probes are equipped with an automatic recognition module and factory calibration data are stored inside. The HD2106.2 is a **datalogger**. It memorizes up to 36,000 conductivity and temperature samples which can be transferred from the instrument connected to a PC via the multi-standard RS232C serial port and USB 2.0. The storing interval, printing, and baud rate can be configured using the menu. The HD2106.1 and HD2106.2 models are fitted with an RS232C serial port and can transfer to a PC the acquired measurements or to a portable printer in real time. The *Max, Min* and *Avg* function calculates the maximum, minimum or average values. Other functions include: the relative measurement REL, the Auto-HOLD function, and the automatic turning off which can also be excluded.
The instruments have IP67 protection degree.

HD 2156.1 E HD 2156.2
pH METER - CONDUCTIVITY METER - THERMOMETER

The **HD2156.1** and **HD2156.2** are portable instruments with a large LCD display. They measure pH, mV, redox potential (ORP), conductivity, liquid resistivity, total dissolved solids (TDS) and salinity using combined 4-ring and 2-ring conductivity/temperature probes. Temperature only is measured by Pt100 or Pt1000 immersion, penetration or contact probes.

The pH electrode calibration, as well as manual, can be carried out on one, two or three points and the calibration sequence can be chosen from a list of 13 buffers. The probe calibration can be performed automatically in one or more of the 147µS, 1413µS, 12880µS or 111800µS/cm conductivity calibration solutions.

The HD2156.2 instrument is a **datalogger.** It stores up to 20,000 sets of three measurements composed of pH or mV, conductivity or resistivity or TDS or salinity and temperature: these data can be transferred to a PC from the instrument connected via the multi-standard RS232C serial port and USB 2.0. The storing interval, printing, and baud rate can be configured using the menu.

The HD2156.1 and HD2156.2 models are fitted with an RS232C serial port and can transfer the acquired measurements to a PC or to a portable printer in real time.

The *Max, Min* and *Avg* function calculates the maximum, minimum or average values.

Other functions include: the Auto-HOLD function and the automatic turning off which can also be excluded.

The instruments have IP67 protection degree.

CONDUCTIVITY TRANSMITTERS

DO 9786T/DO 9766T transmitters convert the output of a conductivity electrode with temperature compensation into a 4÷20 mA signal.
The electrode input circuit is galvanically insulated against the 4÷20 mA output signal. An LCD indicator allows viewing of the process signal value and of the various parameters. The accurate design and choice of components make the instrument precise and reliable for a long working life.
The instrument works in conjunction with a conductivity electrode and a temperature probe (Pt100 sensor, 100 Ω at 0°C).

Calculating the temperature coefficient of a solution
If the temperature coefficient of the solution is not known, it may be determined using the DO 9786T/DO 9766T.
- Set the temperature coefficient at 0.0%/°C (parameter P1).

The following measurements should be taken as close as possible to the work point, between 5°C and 70°C, for greater accuracy.
- Immerse the probe in the testing liquid. Wait for the measurement to become stable.
- Take note of the temperature and of the conductivity.
- Increase the solution temperature by at least 10°C.
- Take note of the temperature and of the conductivity.
- Calculate the temperature coefficient using the following formula:

$$\alpha = \frac{(Gx-Gy) \times 100\%}{Gy(Tx-20) - Gx(Ty-20)}$$ (reference temperature 20°C)

Where:
Gx conductivity at temperature Tx
Gy conductivity at temperature Ty

N.B.: if the reference temperature is 25°C, replace 20 with 25.

- Set the temperature coefficient with the value calculated as above (parameter P1).

Calibration of the instrument for measuring conductivity
The conductivity measurement depends strongly on the temperature of the liquid that is to be measured; this relationship must be considered during calibration.

Calibration of the instrument alone by means of a precision resistance
This is a sure and accurate method for calibrating the instrument alone, but it does not allow for the variations of the cell constant that may occur, nor of the state of efficiency and cleanness of the cell.
The precision resistance used for calibration will be chosen according to the scale that you want to calibrate. Typical values are the following:

Conductivity	Resistance
100,0 µS	10.000 Ω
500,0 µS	2.000 Ω
1000 µS	1.000 Ω
5000 µS	200 Ω
10,00 mS	100 Ω
50,00 mS	20 Ω
100,0 mS	10 Ω
500,0 mS	2 Ω
1000 mS	1 Ω

The precision resistance will be connected to the end of the cable that connects the probe to the instrument. This ensures greater accuracy of calibration. Disable the temperature compensation α_T during the calibration of the instrument with the precision resistences.

Calibration with standard solutions
In this case too, for the calibration of the instrument, cable and measuring probes in a standard solution, the greatest attention must be paid to the temperature of the solutions and the cleanness of the measuring cell. It is advised not to carry out calibration below 500 µS/cm. Solutions with low conductivity must be kept closed in their containers. Contact with the air increases their value due to the absorption of CO_2.
The regulations for the preparation of standard solutions with a base of KCl dissolved in water with a high degree of purity supply the method and percentages of KCl and water to be mixed.
DELTA OHM supplies four solutions for calibration:
HD8747: Standard calibration solution 0.001mol/l equal to 147µS/cm @25°C, 200cc.
HD8714: Standard calibration solution 0.01mol/l equal to 1413µS/cm @25°C, 200cc.
HD8712: Standard calibration solution 0.1mol/l equal to 12880µS/cm @25°C, 200cc.
HD87111: Standard calibration solution 1mol/l equal to 111800µS/cm @25°C, 200cc.

Care and maintenance of the conductivity cell
In conductivity measurement systems in industrial plants, if the installation is correctly made, readings are generally reliable for a long time. The important thing is to carry out correct, programmed maintenance of the measuring cell.
Abrasion of the cable due to continued swinging movements must be avoided, as must the formation of deposits and scale on the cell which can change its geometrical structure.
The cell must always be immersed in the liquid that is to be measured. In the industrial field, measurements may range from highly pure water to sewage or water contaminated by corrosive substances.
It is good practice to check the compatibility of the materials of which the cell and the connecting cable are made with the liquid in which the measurement is to be taken. Check that there are no floating bodies, suspended granules that may be more or less conductive, or which could get stuck inside the cell, thus leading to incorrect measurements.
To clean the cell use detergents or substances suitable for the material of which the cell is made.

Selecting the cell constant and installation
The measurement range of the liquid to be examined determines the choice of the cell constant to be used.
Installation of the cell will vary according to the application. On the whole, the following points must be considered:
- Choose the correct cell and cell constant, suitable for the application.
- Use suitable materials, cable, cell, supports, so as to resist corrosion and the influence of atmospheric agents.
- The sensor/cell must be firmly fixed, in a place where they are easily accessible for maintenance.
- The liquid in which the sensor is immersed must be a representative part of the whole that is to be measured.
- There must be a moderate flow of liquid so that an updated sample of liquid arrives at the electrodes. Excessive movement or flow causes turbulence and air bubbles between the electrodes. As an air bubble is not conductive, it modifies the volume of the cell and changes the constant.
- Install the sensor in such a way that sludge or particles of material cannot be deposited inside it.
- If installed in containers where high currents are circulating, the conductivity cell may present measuring problems.
- The maintenance and cleaning interval depends on the quality of the liquid in which the cell is installed.

HD 2109.1, HD 2109.2
DISSOLVED OXYGEN - TEMPERATURE METERS

The **HD2109.1** and **HD2109.2** are portable instruments with a large LCD display. They measure the concentration (in mg/l) of dissolved Oxygen in liquids, the saturation index (in %) and the temperature using SICRAM combined probes of polarographic type with two or three electrodes and integrated temperature sensor. Temperature only is measured by Pt100–SICRAM or direct 4 wire–immersion, penetration or contact probes. Thanks to an internal pressure sensor, the instruments automatically compensate for barometric pressure. The instrument anticipates automatic compensation of the Oxygen probe membrane permeability and of the salinity of the liquid being examined. The dissolved Oxygen probe's quick calibration function guarantees timely correctness of the performed measurements. The dissolved Oxygen and the temperature probes are equipped with an automatic recognition module and factory calibration data are stored inside. The HD2109.2 is a **datalogger**. It stores up to 18,000 dissolved Oxygen concentration, saturation index measurements, barometric pressure and temperature samples which can be transferred from the instrument connected to a PC via the multi-standard RS232C serial port and USB 2.0. The storing interval, printing, and baud rate can be configured using the menu. The HD2109.1 and HD2109.2 models are fitted with an RS232C serial port and can transfer to a PC the acquired measurements or to a portable printer in real time. The *Max, Min* and *Avg* function calculates the maximum, minimum or average values. Other functions include: the relative measurement REL, the Auto-HOLD function, and the automatic turning off which can also be excluded.

The instruments have IP67 protection degree.

HD 98569
MULTIPARAMETER INSTRUMENT: pH - CONDUCTIVITY DISSOLVED OXYGEN - TEMPERATURE

The **HD 98569** is a portable multi-parameter data logger for electrochemical measures: **pH**, **conductivity**, **dissolved oxygen** and **temperature**. It is fitted with a large back-lighted LCD display.
The instrument measures:

- **pH**, **mV**, **redox potential** (ORP) with pH, redox or combined pH/temperature electrodes **complete with SICRAM module**;
- **conductivity**, **resistivity** in liquids, **total dissolved solids** (TDS), and **salinity** with combined 4-ring and 2-ring conductivity and temperature probes **with SICRAM module**.
- **Concentration of dissolved oxygen** in liquids (in mg/l), **saturation index** (in %) **using SICRAM combined probes** of polarographic type with two or three electrodes and integrated temperature sensor.

The instrument ifs fitted with input for the measurement of **temperature** with Pt100 immersion, penetration or contact probes with SICRAM module.

- The pH electrode calibration can be carried out on one or five points and the calibration sequence can be chosen from a list of 8 buffers. Temperature compensation can be automatic or manual.
- The conductivity probe calibration can be performed with automatically detected conductivity calibration solutions: 147µS/cm, 1413µS/cm, 12880µS/cm, 111800µS/cm or manually with calibration solutions having different values.
- The dissolved oxygen probe's quick calibration function guarantees long-term correctness of the performed measurements.
- pH, conductivity dissolved oxygen and temperature probes fitted with SICRAM module can store factory and calibration data inside.

The HD 98569 is a **data logger**, it stores up to 200 single screens (labels) and up to 9000 samples in continuous storage mode: pH or mV, conductivity or resistivity or TDS or salinity, concentration of dissolved oxygen and saturation index and temperature.
The data can be transferred from the instrument connected to a PC via the multi-standard RS232C serial port and USB 2.0-1.1.
The instruments equipped with **HD22BT** Bluetooth option can transfer the data without any connection to a PC fitted with USB/Bluetooth converter HD USBKL1, or to the printer *HD40.2* with Bluetooth interface or to a PC with Bluetooth input.

The serial connection RS232C can be used for direct printing of labels with a 24 column printer (*HD40.1 or HD40.2*).
The software **DeltaLog11** (vers. 2.0 and subsequent ones) allows instrument management and configuration, and data processing on PC.

BENCH-TOP pH AND CONDUCTIVITY METER

The HD3456.2 is a bench top instrument for electrochemical measures: **pH**, **conductivity and temperature**.
The displayed data can be stored **(datalogger)** and can be transferred to PC or serial printer thanks to the multi-standard serial port RS232C and USB2.0 and software DeltaLog9 (Vers.2.0 and subsequent ones). The storing and printing parameters can be set from menu.

The **HD3456.2** measures **pH**, **mV**, **redox potential** (ORP), **conductivity**, **resistivity in liquids**, **total dissolved solids** (TDS), and **salinity** using combined 4-ring and 2-ring conductivity/temperature probes. **Temperature** is measured by Pt100 or Pt1000 immersion, penetration or contact probes.
The pH electrode calibration, as well as manual, can be carried out automatically on one, two or three points and the calibration sequence can be chosen from a list of 13 buffers.
The conductivity probe calibration can be performed automatically in one or more of the 147µS, 1413µS, 12880µS or 111800µS/cm conductivity calibration solutions.

The display shows continually the temperature in °C or °F and one selectable parameter according to the connected probe type, i.e. in case of conductivity probe it is possible to select between χ or Ω or TDS or g/l.
Other functions of this instrument include: Max, Min and Avg function, the Auto-HOLD function, the automatic turning off which can also be disabled.
The instruments have IP66 protection degree.

- The conductivity probe calibration can be performed automatically with automatically detected conductivity calibration solutions: 147µS/cm, 1413µS/cm, 12880µS/cm or 111800µS/cm or manually with calibration solutions having different values.
- Conductivity, dissolved oxygen and temperature probes fitted with SICRAM module can store factory and calibration data inside.

The data can be transferred from the instrument connected to a PC via the multi-standard RS232C serial port and USB 2.0. The storing parameters can be configured using the menu.
The RS232C serial port can be used to transfer the acquired measurements to a 24 column portable printer in real time (HD40.1 or HD40.2).
The instruments equipped with **HD22BT** (Bluetooth) option can transfer data without any connection to a PC or printer fitted with Bluetooth input or through Bluetooth/RS232C converter.
The software DeltaLog11 allows instrument management and configuration, and data processing on PC.
The instruments have IP66 protection degree.

HD 3409.2
BENCH-TOP DISSOLVED OXYGEN METER

The **HD3409.2** is a bench top instrument for electrochemical measures: **dissolved oxygen** and **temperature**.
The displayed data can be stored **(datalogger)** and can be transferred to PC or serial printer thanks to the multi-standard serial ports RS232C and USB2.0 and software DeltaLog9 (Vers.2.0 and subsequent ones). The storing and printing parameters can be set from menu.
The **HD3409.2** measures the **concentration** (in mg/l) **of dissolved Oxygen in liquids**, the **saturation index** (in %) and the **temperature** using SICRAM combined probes of polarographic type with two or three electrodes and integrated temperature sensor. **Temperature** is measured by Pt100-SICRAM or direct 4 wire-immersion, penetration or contact probes.
Thanks to an internal pressure sensor, the instruments automatically compensate for barometric pressure. The instrument anticipates automatic compensation of the Oxygen probe membrane permeability and of the salinity of the liquid being examined. The dissolved Oxygen probe's quick calibration function guarantees timely correctness of the performed measurements.

The display shows continually the temperature in °C or °F and one selectable parameter according to the connected probe type,Printing and storage always include the temperature in °C or °F and one selectable parameter for each probe type.
Other common function of this instrument series include: Max, Min and Avg function, the Auto-HOLD function, the automatic turning off which can also be excluded.
The instruments have IP66 protection degree.

HD 25.2
BENCH-TOP TURBIDITY METER

The **HD25.2** is a digital turbidity meter for laboratory and mobile use, suitable for measurements in drinking water, waste water and process liquids. The working principle is based on the nephelometric (90° scattered light sensor) method.
It is equipped with three light detectors and two LED light sources (white and infrared) which are permanently kept under control in order to guarantee long-term stability. The instrument performs measurements according to the standards **EPA 180.1, ISO-NEPH (ISO 7027), EBC and ASBC.** It is also able to carry out measures of transmission factor percentage of white and infrared light.

The initial factory calibration is based on Forazin primary standard. For routine calibration a set of stabilized secondary standard solutions is available: STCAL (Turbidity standards for calibration):

- **STCAL 1** less than 0,05 NTU
- **STCAL 2** equal to 8 NTU
- **STCAL 3** equal to 80 NTU
- **STCAL 4** equal to 800 NTU

User Calibration is automatic on one, three or four points, depending on the measuring variable.
Stabilized power supply and advanced electronics garantee optimal performances over time.
The HD25.2 is a **datalogger** that stores up to 999 samples.
The data can be transferred from the instrument connected to a PC via the multi-standard RS232C serial port and USB 2.0.
The RS232C serial port can be used to transfer the acquired measurements to a 24 column printer.

The Print function allows to print labels with progressive numeration and automatic incrementation, with all data related to the sample being examined.
The dedicated software **DeltaLog11** allows instrument management and data processing on PC.

The use of the HD25.2 by more customers is facilitated by the “User Mangement” function, which allows, according to the case, to enable or disable some advanced functions of the instrument through password.
The protection degree is IP66.
